

TEKUN Collection Partnership

Internal Technical and Operations Briefing

How the platform, people, controls, evidence and roadmap connect end to end

Confidential — internal working use only
31 August 2026

35-slide core briefing + 7-slide optional reference appendix

Purpose of this briefing

Give product, engineering, operations, finance, compliance and leadership one shared model of what we are proposing, what is known, what remains to be discovered and how we prove value safely.

The external story is concise. This deck preserves the operating detail needed to design, estimate and govern the work.

The truth boundary

Established or publicly stated

- TEKUN Corporation is an established collection operator.
- Its public history includes a collection call centre since 2015.
- It publicly states approximately 30 appointing organisations.
- Public collection or recovery appointments continued in 2026.
- Sifututor has operated live services since 2018; new SIMS went live in May 2025.

Proposed or conditional

- The platform and managed service described here do not yet exist for TEKUN.
- Portfolio applicability, authority, privacy roles and registration status require confirmation.
- Current systems, providers, volumes, economics and baseline are not publicly known.
- No outcome, date, staffing level or price is promised.

Evidence known today

Evidence	Practical meaning	Use constraint
TCorp registration and 2015 collection-centre history	Established operating identity	Attribute to TCorp
MOF field code and ~30 appointments stated publicly	Multi-principal operating context	Reverify current figure
Awqaf Education and MOCCIS activity in 2026	Continuing market activity	No value, volume or performance inferred
Consumer-credit framework and standards	More explicit operational controls	Apply portfolio by portfolio
Sifututor live platform history	Relevant platform-operating proof	Not debt-collection proof

Material unknowns drive discovery—not speculation

- Current platform, dialler, CRM, payment and reporting architecture
- Internal and third-party operating responsibilities
- Provider identity, contract value, commission basis and transition terms
- Portfolio owners, products, volumes, ageing and contactability
- Registration/authorisation status by legal entity and activity
- Payment recipient, receipt issuer and reconciliation authority
- Baseline performance, cost, complaints, conduct and service health
- Data-controller/processor roles, retention and security obligations

Rule: unknown does not mean absent, weak or non-compliant.

Proposed operating model

TEKUN Corporation owns and governs the platform. Our team builds, operates, maintains and improves it while performing or coordinating only authorised collection work.

The model connects:

1. portfolio and policy authority;
2. platform delivery and service operations;
3. controlled customer engagement;
4. payment evidence and reconciliation;
5. reporting, assurance and improvement.

Responsibility model

TEKUN Corporation

- Principal relationships
- Policy and risk appetite
- Portfolio acceptance
- Consequential authority
- Strategic and regulatory oversight

Partner delivery

- Platform build and operation
- Authorised service execution
- Integrations and evidence
- Monitoring and support
- Improvement and transition

Joint governance

- Baseline and KPIs
- Pilot and service levels
- Incidents and changes
- Learning and roadmap
- Expansion gates

Authority is explicit at every consequential moment

Moment	System behaviour	Human authority
Portfolio acceptance	Validate and quarantine until accepted	TEKUN/principal authority
Strategy assignment	Apply approved policy version	TEKUN collection governance
Settlement/write-off	Recommend and route; never auto-assume	Named accountable party
Legal escalation	Hold until prerequisites and approval exist	Legal/TEKUN authority
Complaint/hardship	Pause standard treatment and assign specialist	Approved specialist/governance
Policy override	Require reason, approver and audit	Delegated authorised role

Core collection lifecycle

**Intake → Validate → Segment → Assign → Notify → Verify → Engage →
Promise/protect/escalate → Pay → Reconcile → Cease/close → Report and improve**

Every transition needs:

- entry criteria and source data;
- allowed action and accountable owner;
- authority and customer-treatment gates;
- outcome, timestamp and evidence;
- retry, exception, hold and recovery behaviour.

Case state is more than “open” or “closed”

State family	Example states	Why separation matters
Intake	received, rejected, quarantined, accepted	Prevents bad data entering production work
Work	ready, assigned, due, attempted, awaiting follow-up	Makes workload and ownership visible
Promise	proposed, accepted, due, kept, broken, superseded	Prevents false success from an unverified promise
Protection	dispute, hardship, vulnerability, complaint, legal hold	Removes protected cases from standard pressure
Payment	reported, evidenced, matched, reconciled, reversed	Creates trustworthy outcomes
Closure	settled, arrangement, withdrawn, returned, exhausted	Explains why collection stopped

Logical platform architecture

1. **Experience:** agent, supervisor, management, compliance, finance and principal views.
2. **Portfolio authority:** principal, product, agreement, account, case and policy.
3. **Controlled interaction:** queues, notices, verification, contact, promises and holds.
4. **Evidence and money:** payment source, reconciliation, reversals and cessation.
5. **Enterprise intelligence:** performance, conduct, service health, risk and roadmap.

Information hierarchy and segregation

Enterprise → Principal → Portfolio → Product/policy → Customer/account → Case → Interaction/evidence

- A principal sees only its authorised portfolios.
- Policies are versioned and attached to the correct population.
- A customer may have more than one account; each debt and authority chain remains distinct.
- Case activity never changes an authoritative balance without an approved write path.
- Imports, withdrawals and corrections preserve provenance.
- Enterprise analytics use governed aggregation without weakening principal boundaries.

Front-line workspace design

Agent sees

- prioritised cases and due work;
- verified context and approved next action;
- identity and disclosure steps;
- contact history, promises and payment status;
- clear protected-case and escalation routes;
- only the information needed for assigned work.

System prevents or redirects

- action outside contact policy;
- disclosure before identity verification;
- work on a settled, held or withdrawn case;
- unapproved channel, script or notice;
- payment receipt by representatives;
- consequential decisions outside authority.

Supervisor and control workspaces

Supervisor

- queue health and capacity;
- ageing, unreachable cases and due promises;
- representative competency and quality;
- exceptions, complaints and protected cases;

- workload rebalance and coaching evidence.

Independent control views

- compliance: contact, notice, disclosure and conduct exceptions;
- privacy/security: access, export and incident evidence;
- finance: payment, match, reversal and ageing exceptions;
- management: portfolio, service, cost, value and risk.

Customer-treatment controls become product requirements

- Identity gate before debt disclosure
- Configurable contact window, frequency and channel policy
- Approved notice template, mandatory fields, version and delivery evidence
- No third-party disclosure without confirmed authority
- No representative receipt of money
- Immediate stop or redirect on authoritative settlement/arrangement event
- Protected queues for disputes, hardship, vulnerability and complaints
- Appointment, training, assessment and authorisation currency
- Complete evidence for action, override, approval and exception

Final configuration follows confirmed applicability and TEKUN-approved policy.

Protected branches need their own lifecycle

Trigger → Immediate hold → Specialist ownership → Assessment/evidence → Approved resolution → Controlled return or closure

Protected cases include:

- disputed balance, identity or liability;
- hardship and vulnerability;
- deceased, bankrupt or legally restricted status;
- complaint or alleged misconduct;
- legal hold or principal withdrawal;
- confirmed settlement or accepted arrangement.

No performance target may silently release a hold or return a case to ordinary treatment.

Promise, payment and reconciliation are separate facts

Promise made $\neq$ payment reported $\neq$ evidence received $\neq$ payment reconciled

- Customer pays through an approved official channel.
- Representatives record conversation and promise but never receive funds.
- Finance or an authoritative feed supplies transaction evidence.
- Matching handles reference quality, duplicates, partials and reversals.
- Unmatched evidence remains visible as an exception.
- Reconciled truth changes treatment and feeds outcome reporting.
- Any fee calculation uses agreed qualifying reconciled evidence.

Integration catalogue

Interface	Direction	Core controls
Principal portfolio feed	Inbound	Schema, source, dedupe, corrections and withdrawals
Status/performance report	Outbound	Definitions, approval and principal segregation
Messaging/telephony	Two-way	Identity, channel, timing, frequency and evidence
Payment evidence	Inbound	Source validation, duplicates, reversal and retry
Notices/documents	Outbound	Approved version, content and delivery evidence
Regulatory/reporting support	Outbound	Accountable submitter and approval before release
Analytics	Read-oriented	Curated access, masking, audit and governed definitions

Trust model

Prevent and contain

- strong authentication and least privilege;
- principal, portfolio and role boundaries;
- encryption, minimisation and controlled export;
- validated interfaces and named write paths;
- tamper-evident material event history.

Detect and recover

- service, feed, queue and unusual-access monitoring;
- severity, ownership and incident communication;
- protected backups and restore testing;
- controlled releases, rollback and post-release checks;
- lessons converted into controls and runbooks.

Reporting layers share one governed truth

Audience	Decision view
Agent	What should I safely do now?
Supervisor	Where are workload, quality and exceptions drifting?
Finance	Which reported outcomes are reconciled?
Compliance/privacy	Where are conduct, complaint or access risks?
Collection management	Which strategies and cohorts are working?
Principal	What happened within my authorised portfolio?
TCorp leadership	Is the service healthy, valuable and ready to expand?

Managed operating cells

- **TCorp service owner:** relationships, policy, authority and outcomes
- **Collection manager:** strategy, allocation, performance and escalation
- **Supervisor:** daily queues, capacity, coaching and exceptions
- **Authorised representatives:** controlled contact and evidence
- **Protected-case specialists:** disputes, complaints, hardship and vulnerability
- **Finance/reconciliation:** payment truth and exceptions
- **Compliance/privacy:** independent interpretation and oversight
- **Platform operations:** service, integrations, incidents and recovery
- **Product/improvement:** friction analysis and governed roadmap

Competency and quality lifecycle

Screen → Train → Assess → Authorise → Observe/sample → Coach/remediate → Reassess

Quality must balance:

- outcome and productivity;
- correct identity and disclosure;
- accuracy of explanation and record;
- compliant timing, frequency, notice and channel;
- appropriate complaint, dispute and hardship handling;
- evidence completeness;
- security and privacy behaviour.

A material concern can suspend authorisation before the next periodic review.

Service management closes the operational loop

Observe → Detect → Triage → Correct → Verify → Release/adopt → Monitor → Learn

- A software incident, failed feed, queue spike or conduct exception follows a named response path.
- Business, technology and control owners see the same event with different responsibilities.
- Changes require evidence for both the technical component and the human journey.
- Rollback, recovery and communication are planned before release.
- Repeated friction becomes a jointly prioritised improvement item.

Our relevant capability foundation

Existing capability	Relevance	Boundary
SIMS operating core	Identities, workflows, finance and reports	Not a debt system
Ripple staff workspace	Queues, roles and governed decisions	Collection design is new
Kelasapp separation	Multi-organisation patterns	New isolation needs proof
Finch conversations	Multi-channel ownership	Channels need approval
Mobile/self-service	Authenticated participant communication	Customer portal would be new
Analytics and monitoring	Curated insight and service health	TEKUN definitions are new
Agent OS	Evidence, playbooks and human oversight	Not legal or collection authority

Capability-to-value chain

Connected data and guided work improve case context and consistency. Payment integration turns claimed outcomes into reconciled truth. Customer-treatment controls protect service credibility. Reliable reporting builds principal confidence. Repeatable onboarding creates growth capacity.

Technology → operating signal → verified outcome → strategic contribution

Portfolio mix, customer circumstances, policy, staffing, authority and economic conditions remain material influences.

Balanced scorecard

Lens	Core questions
Operations	Are cases workable, owned and acted on at the right time?
Financial	Which qualifying outcomes are reconciled and at what cost?
Portfolio	Are cohorts curing, rolling or ageing differently?
Customer treatment	Are complaints, disputes, hardship and cessation controlled?
Compliance	Did notices, contact, identity, disclosure and data access stay within policy?
Platform health	Is the service available, recoverable and receiving reliable feeds?
Strategic growth	Can TCorp onboard and retain more principals without uncontrolled reinvention?

KPI definitions are contracts about meaning

Example definitions

- Right-party contact = $\text{verified customer conversations} \div \text{valid attempts}$
- Kept promise = $\text{due promises fulfilled within agreed tolerance} \div \text{promises due}$
- Collection rate = $\text{reconciled qualifying amount} \div \text{agreed amount due}$
- Recovery rate = $\text{reconciled recovery from named frozen cohort} \div \text{cohort opening value}$

Every KPI also needs

- population and time window;
- authoritative source;
- owner and refresh frequency;
- exclusions and adjustment events;
- quality threshold;
- known misuse or misinterpretation risk.

Pilot design: prove the whole system, not one number

- One principal, product or controlled cohort
- Written comparable baseline and known changes
- Confirmed authority, representatives, channels and policy
- Minimum complete lifecycle with payment evidence and service monitoring
- Weekly operating and monthly governance reviews
- Outcome, conduct, reconciliation and platform-health evidence
- Explicit expand, adjust, re-baseline or stop decision

Roadmap I: establish trust and prove control

H0 — Align and baseline

- Stakeholder, authority and portfolio map
- Current lifecycle, provider and system map
- Data and money-flow architecture
- KPI dictionary and pilot cohort

H1 — Trusted foundation

- Principal/portfolio model and segregation

- Identity, roles, policy versions and audit
- Intake, queues and health monitoring
- Core journey and recovery evidence

H2 — Controlled pilot

- Authorised live work
- Customer-treatment and protected branches
- Payment evidence, reconciliation and reporting
- Balanced evidence gate

Roadmap II: scale only after evidence

H3 — Integrated performance scale

- Automated portfolio and payment feeds
- Stable reconciliation and reporting
- Service levels and capacity planning
- Governed strategy comparison

H4 — Multi-principal growth

- Reusable onboarding and policy configuration

- Tested tenant/principal segregation
- Accepted per-principal reporting
- Controlled operational expansion

H5 — Governed intelligence

- Explainable summaries and quality assistance
- Forecasting only from sufficient clean history
- Bias/control review and human authority
- Evidence-led strategy and joint roadmap

Commercial architecture comes after operational truth

- Separate mobilisation, platform and managed-service components.
- Confirm portfolio volumes, channels, hours, roles and integrations first.
- Use only reconciled qualifying evidence for any outcome-linked element.
- Balance outcome incentives with customer-treatment guardrails.
- Define communication and third-party pass-through costs transparently.
- Preserve export, documentation and transition support.
- Revisit economics after pilot evidence rather than pricing assumptions.

No pricing model or fee percentage is approved in this deck.

Discovery workstreams

Business and control

- Entities, principals and portfolios
- Authority and regulatory applicability
- Policy, notices and customer treatment
- Baseline, KPIs and commercial inputs
- Workforce, competency and governance

Platform and transition

- Current systems, providers and contracts
- Data model, interfaces and money flow
- Privacy, security, retention and recovery
- Pilot cohort and acceptance evidence
- Migration, coexistence and transition support

Delivery governance and assurance

Forum	Cadence	Purpose
Joint steering	Quarterly or at major gate	Strategy, value, roadmap and principal expansion
Performance forum	Monthly	Cohorts, outcomes, capacity, finance and actions
Compliance/customer-treatment forum	Monthly and event-driven	Conduct, complaints, holds, privacy and remediation
Delivery/change forum	Weekly	Product, engineering, incidents, releases and dependencies
Daily operations	Daily	Queues, staffing, exceptions and service health

A collection target cannot excuse a conduct failure. A control issue cannot be hidden inside a performance report.

Risks we control through design

- **Wrong authority:** explicit responsibility and approval maps
- **Wrong customer or disclosure:** identity gates and minimum information
- **Over-contact or invalid notice:** policy engine, schedule and version evidence
- **Continued contact after resolution:** authoritative cessation events and exception alerts
- **False performance:** reconciled evidence and governed cohorts
- **Principal data leakage:** segregation, access review and export controls
- **Failed integration or service:** monitoring, retry, incident and recovery evidence
- **Unhealthy lock-in:** export, documentation, configuration history and transition readiness

Internal next step

Prepare one governed discovery and pilot co-design package

It must produce the current-state map, authority model, portfolio segmentation, data/money flows, baseline, KPI dictionary, pilot cohort, minimum architecture, transition approach, evidence plan and commercial inputs.

Build only after we know who has authority, what truth sources exist, how success is measured and how customer treatment is protected.

End the core briefing here. Slides 36–42 are optional working-reference appendices.

Internal appendix: KPI dictionary I

ID	Indicator	Owner	Interpretation safeguard
O1	Contact coverage	Collection manager	Pair with frequency compliance; volume is not quality
O2	Right-party contact rate	Collection manager	Data quality and identity rules affect result
O3	Promise-to-pay rate	Collection manager	Pair with kept promises
O4	Kept-promise rate	Collection manager/finance	Fix tolerance; use reconciled evidence
O5	Time to first substantive action	Collection manager	Define substantive to prevent gaming
F1	Reconciled amount collected	Finance	Exclude reversals, dishonoured and misapplied payments
F2	Collection rate	Finance	State due amount, cohort, period and exclusions
F3	Recovery rate	Finance	Freeze opening cohort and adjustment rules
F4	Net recovery	Finance	Agree attributable cost method
F5	Cost-to-collect	Finance	Segment by portfolio mix and arrears age

Internal appendix: KPI dictionary II

ID	Indicator	Owner	Interpretation safeguard
P1	Ageing/PAR	Finance	State threshold, balance and restructure treatment
P2	Roll rate	Collection manager	Requires reliable point-in-time snapshots
P3	Cure rate	Collection manager	Separate payment cure from restructure cure
T1	Complaint rate	Compliance	Low rate may indicate inaccessible intake
T2	Complaint resolution time	Compliance	Track ageing and overdue cases
T3	Hardship outcome/timeliness	Compliance	Approval rate alone is not quality
T4	Cessation compliance	Compliance	Investigate every exception
C1	Contact-window exceptions	Compliance	Confirm target and rule set
C2	Identity-verification exceptions	Compliance	Debt-discussion population must be reliable
C3	Contact-frequency exceptions	Compliance	Count across all integrated channels
C4	Notice-gate compliance	Compliance	Validate fields and delivery evidence

Internal appendix: KPI dictionary III

ID	Indicator	Owner	Interpretation safeguard
C5	Third-party disclosure exceptions	Compliance/privacy	Consent and relationship evidence required
C6	Payment-handling exceptions	Compliance	Representative receipt should be zero where rule applies
C7	Representative validity/competency	Compliance/operations	Active population and due dates current
C8	Data-access anomalies	Privacy/security	Track investigation and closure, not alerts alone
H1	Critical-workflow availability	Platform operations	Measure safe journey, not homepage only
H2	Incident restore time	Platform operations	Segment by severity
H3	Recovery proof freshness	Platform operations	Successful backup is not successful restore
H4	Reconciliation ageing	Finance/platform	Pair value, item count and cause
S1	Principal onboarding lead time	TCorp management	Write start/end conditions
S2	Capacity headroom	TCorp management	Quality and conduct remain constraints

Every KPI record also needs formula, population, period, source, exclusions, frequency, target type and gaming risk.

Internal appendix: discovery questions 1–12

1. Which outcomes should improve, in priority order?
2. What is the main operating constraint today?
3. What defines success for management, board and principals?
4. Which regulatory pathway and current status applies to each portfolio?
5. Which activities could a partner perform, under what authorisation?
6. Who holds settlement, restructure, write-off, legal and closure authority?
7. Which complaints, hardship, conduct and reporting processes are mandatory from day one?
8. Which appointing organisations and portfolios are active?
9. What products, volumes, value, ageing, geography and history are involved?
10. How are accounts assigned, updated, suspended, returned and closed?
11. Which activities are performed by TCorp staff?
12. Are external providers used for operations, people, technology, channels, data, payment, field or legal work?

Internal appendix: discovery questions 13–24

13. What does each provider do and what transition or contract constraints exist?
14. Which systems support the lifecycle today?
15. How are queues and treatment strategies defined and approved?
16. How are identity, contact, notice, consent, promises and cessation evidenced?
17. How are complaints, disputes, hardship, vulnerability and legal holds handled?
18. How are representatives trained, authorised, supervised and assessed?
19. Where do customers pay and what event stops collection?
20. Who reconciles payment, in which system and cycle?
21. What data arrives from each principal and which quality issues matter?
22. Which integrations exist or are required?
23. What privacy/data roles, hosting, retention, breach, export and audit constraints apply?
24. Which cohort and scorecard should govern a bounded pilot?

Internal appendix: assurance and transition evidence

Assurance question	Required evidence
Are only authorised people acting?	Identity, role, competency and authorisation records
Are actions permitted now?	Notice, contact, consent, hold and authority gates
Was the customer treated fairly?	Interaction, quality, complaint and hardship evidence
Is a collection result real?	Reconciled payment evidence and cohort definition
Did payment stop action correctly?	Cessation timestamp and post-stop exception report
Is each principal separated?	Access/isolation tests and principal-scoped reporting
Can an incident be understood and service recovered?	Monitoring, audit, incident, backup and restore evidence
Can TCorp govern or transition?	Documentation, export and tested transition exercise

Transition inventory: data export; configuration/policy versions; data dictionary; interface specifications; runbooks; protected-case registers; permitted history; reconciliation evidence; access tests; recovery proof; change logs; cessation evidence; transition plan.

Internal appendix: commercial archetypes

Model	Strength	Risk	Appropriate use
Fixed platform and operating fee	Predictable; funds essential controls	Weak direct outcome alignment	Foundation and minimum service
Per-account or capacity fee	Scales with workload	Can reward volume over resolution	Clear workable population
Success fee	Strong outcome alignment	Conduct pressure, cohort bias and disputes	Strict guardrails and reconciled evidence only
Gain-share above baseline	Pays for measured improvement	Depends entirely on baseline integrity	After defensible pilot/baseline
Hybrid fixed plus performance	Funds reliability while sharing upside	More calculation/governance detail	Recommended direction after discovery

No model, price or percentage is approved. Any variable component must remain subject to customer-treatment and service guardrails.
