

TEKUN Corporation Integrated Collection Growth Partnership

A TEKUN Corporation-owned collection platform, authorised managed operations and an evidence-led path to scale

Document control	Detail
Status	Discussion proposal — not a contract or final implementation commitment
Prospective client	TEKUN Corporation Sdn Bhd
Prepared by	Sifututor capability team; proposing legal entity and authorised contact to be confirmed before circulation
Document owner	Hafiz / designated proposal owner
Version	Draft 1.0
Date	31 August 2026
Classification	Confidential — controlled stakeholder use
Legal position	Portfolio applicability, authorisation and legal responsibilities require confirmation
Commercial position	No price, guaranteed result or final commercial commitment is made

This proposal is intended to support a structured decision on discovery and pilot co-design. It respects TEKUN Corporation as an established collection operator and does not assume that its present operation, systems or service partners are deficient.

Contents

Part	Sections
Strategic case	1. Executive summary · 2. Opportunity · 3. Why now
Partnership and authority	4. Partnership model · 5. Ownership, authority and accountability · 6. Collection lifecycle
Platform solution	7. Platform in plain language · 8. Role-based workspaces · 9. Customer treatment · 10. Payment and reconciliation · 11. Data, integration, security and resilience · 12. Reporting and assistance
Managed service	13. Managed collection service · 14. Training, competency and quality · 15. Service management and improvement
Proof and value	16. Why our experience is relevant · 17. Business impact · 18. Balanced scorecard · 19. Bounded pilot · 20. Commercial principles
Direction and decision	21. Milestones and roadmap · 22. Long-term value, assurance and transition readiness · 23. Discovery agenda · 24. Recommended next decision

Reading guide: Executive and board readers may prioritise Sections 1–5 and 17–24. Operations, compliance, finance and technology teams should also review Sections 6–16.

1. Executive summary

TEKUN Corporation already has collection experience, client relationships and an established operating identity. **TCorp states** that its debt-collection customer call centre has operated since 2015, that it is registered with the Ministry of Finance under field code 221105 and that approximately 30 organisations have appointed it. Its official 2026 announcements also describe continuing collection or recovery appointments. The opportunity is therefore not to start a collection business from zero. It is to connect and strengthen an existing capability.

We propose a partnership with two integrated components:

- 1. a **dedicated collection platform owned and governed by TEKUN Corporation**, designed, built, operated, maintained and continuously improved by our team; and
- 2. an **authorised managed collection operation**, performed or coordinated by our team within confirmed policy, contractual and legal boundaries.

Together, these components create one operating spine across portfolio intake, segmentation, assignments, controlled contact, promises, protected cases, payment evidence, reconciliation, cessation, reporting and improvement. TEKUN Corporation retains governance, policy and consequential authority. Our team supplies platform engineering, service operations, evidence, support and improvement.

The recommended decision is deliberately bounded: authorise discovery and pilot co-design, then commit to implementation only when authority, evidence, customer-treatment, technical and commercial gates are satisfied.

What this creates

- clearer case ownership and authorised next actions;
- consistent and provable customer treatment;
- payment outcomes tied to reconciled evidence rather than unverified reports;
- segregated reporting for each principal and an enterprise view for TEKUN Corporation;
- a repeatable way to onboard additional portfolios and appointing organisations;
- platform health, service management and improvement disciplines around daily collection work.

2. The opportunity: strengthen an established operator

The proposal begins with a respectful fact: TEKUN Corporation is already active in credit management and recovery. TCorp's own public materials state corporate registration in 2014 and establishment of its debt-collection customer call centre in 2015; its dated announcements describe new collection or recovery activity in 2026.

This history matters because the partnership should preserve TEKUN Corporation's identity, principal relationships and operating knowledge. The platform and managed service are intended to make that capability easier to govern, measure and scale.

Existing foundation	Partnership contribution
Collection experience and organisational standing	A connected digital operating model and evidence trail
Principal and stakeholder relationships	Segregated portfolios, reports and repeatable onboarding
Policy and authority	Configurable controls, approvals and auditable exceptions
Collection teams and practical knowledge	Guided workspaces, quality systems and operational analytics
Business-growth mandate	A measurable path from capacity to sustainable contribution

Public information does not disclose TEKUN Corporation's current platform, detailed performance baseline, portfolio volumes, commission model or any current third-party arrangement. This proposal makes no assumption about those matters. They form part of discovery.

3. Why now

Malaysia's consumer-credit environment places greater emphasis on authorisation, conduct, evidence and complaints handling. Published expectations translate directly into operating requirements: controlled contact, identity verification, notices, non-disclosure, payment handling, hardship and complaint pathways, representative competency and information security.

Actual applicability must be determined portfolio by portfolio. A multi-principal operator may serve products and organisations that follow different legal pathways. The practical answer is not a single blanket rule; it is a policy-controlled platform that can apply the correct approved treatment to each portfolio and retain evidence of what happened.

4. Proposed partnership model

TEKUN Corporation governs

- client and principal relationships;
- platform ownership and strategic direction;
- portfolio acceptance, policy and risk appetite;
- authority limits, settlement, write-off and legal escalation decisions as agreed;
- regulatory, compliance and customer-treatment oversight;
- approval of expansion to further portfolios or principals.

Our team delivers

- platform discovery, design, implementation and integration;
- secure operation, monitoring, maintenance and recovery;
- authorised collection execution or coordination;
- operating procedures, training support, supervision and quality tools;
- reporting, analytics and evidence;
- continuous improvement and transition support.

Jointly governed

- baseline and KPI definitions;
- pilot scope and success gates;
- service levels and escalation paths;
- incidents, material changes and lessons;
- roadmap priorities and expansion decisions.

The relationship should remain durable because it continues to create measurable value—not because TEKUN Corporation cannot leave. Data, configuration, operating records and documentation should therefore remain usable and exportable from the beginning.

5. Ownership, authority and accountability

The platform must preserve the difference between owning a portfolio, governing collection, performing work, receiving money, verifying payment and making consequential decisions.

Decision or activity	Proposed accountable party	Delivery or support
Principal relationship and portfolio acceptance	TEKUN Corporation	Portfolio owner consulted; partner supports
Collection policy and treatment strategy	TEKUN Corporation within principal authority	Partner configures and operates approved rules
Platform build and operation	Partner delivery team	TEKUN Corporation governs priorities and acceptance
Daily case work	Authorised collection operation	Platform guides and records work
Receipt of customer money	Approved official channel, to be confirmed	Representatives never receive customer money
Payment reconciliation	Named finance authority, to be confirmed	Platform imports, matches and exposes exceptions
Settlement, write-off and legal action	TEKUN Corporation or portfolio owner as agreed	Operation recommends or escalates only
Complaints, dispute and hardship	Named TEKUN/portfolio authority	Specialist operation and platform hold controls
Regulatory submission	Accountable entity to be confirmed	Platform supplies controlled evidence and export

No system permission should imply authority that has not been explicitly granted. Overrides, approvals and policy changes must be attributable, time-stamped and auditable.

6. End-to-end collection lifecycle

The solution is a complete operating loop rather than a stand-alone dialler, messaging tool or dashboard.

Confidential — controlled stakeholder use

Stage	Core purpose	Required evidence or control
Intake	Establish an authoritative portfolio population	Source, schema, balance, history, duplication and withdrawal checks
Segment	Apply an approved strategy to the correct cohort	Product, arrears, risk, exclusions and strategy version
Assign	Give each case a responsible owner	Team, competency, authority, language and workload
Notify	Issue required approved communication	Template, version, timing, mandatory information and delivery evidence
Verify	Confirm the correct person before disclosure	Verification outcome without unnecessary exposure
Engage	Perform controlled contact and record outcome	Time, frequency, channel, script, conduct and complete interaction history
Promise	Record a specific commitment accurately	Amount, date, method, tolerance and follow-up
Protect	Divert disputes, hardship, vulnerability and legal holds	Immediate hold, specialist owner and release/closure decision
Pay	Direct the customer to an approved channel	No agent receipt of funds; official instruction retained
Reconcile	Match payment evidence to the correct account	Source evidence, allocation, reversal and unmatched exceptions
Cease/close	Stop or adjust treatment when authority changes	Authoritative event, time-to-stop and post-stop exception
Report/improve	Turn events into management and principal insight	Governed definitions, portfolio segregation and approved learning

7. Platform solution in plain language

The platform is organised into five connected layers:

1. **Experience layer** — the right workspace for agents, supervisors, management, compliance, finance and each principal.
2. **Authoritative portfolio layer** — principals, portfolios, customers/accounts, cases, agreements, balances and policy versions.
3. **Controlled interaction layer** — queues, notices, identity steps, contacts, promises, complaints and holds.
4. **Evidence and money layer** — payment evidence, reconciliation, reversals, cessation and outcome history.
5. **Enterprise intelligence layer** — service health, performance, customer treatment, risk, financial contribution and roadmap insight.

Each principal should see only its authorised portfolio. TEKUN Corporation retains the governed enterprise view across principals, policies, service health and strategic outcomes.

8. Role-based workspaces

Agent workspace

An authorised representative sees prioritised cases, verified context, the permitted next action, approved communication, identity requirements, contact history, promises and escalation routes. The system blocks or redirects actions that are outside policy.

Supervisor workspace

A supervisor sees workload, ageing, unreachable accounts, promises due, quality results, exceptions, complaints, holds, staffing and capacity. Supervisors can coach and rebalance work within approved authority, but cannot silently override customer-treatment controls.

Management and principal views

Management sees outcomes, cost, service health, risks and improvement. Each principal sees its own accepted definitions and portfolio evidence. Compliance and finance receive independent exception views appropriate to their responsibilities.

9. Customer treatment by design

Customer treatment is part of the operating system, not a separate policy document. The proposed design supports:

- identity verification before account discussion;
- approved contact windows, frequency and channels;
- controlled notices, scripts and versions;
- prevention of disclosure to unauthorised third parties;
- immediate holds and specialist routing for disputes, complaints, hardship, vulnerability and legal conditions;
- cessation or treatment change following authoritative settlement or arrangement events;
- an accessible complaint record and resolution trail;
- representative appointment, training and competency evidence;
- human authority for consequential outcomes.

Final controls must be approved against the applicable portfolio, governing agreements and qualified Malaysian legal advice. The platform can enforce and prove an approved rule; it cannot itself decide what the law means.

10. Payment evidence and reconciliation

A reported promise or claimed payment is not yet a verified collection result. The platform should distinguish:

- promise made;
- payment reported by a customer;
- payment evidence received;
- payment matched and reconciled;
- reversal or adjustment;
- case treatment changed or ceased.

Representatives direct customers to approved payment routes and do not receive money. The final payment recipient, receipt issuer, evidence source, reconciliation owner and service timing must be agreed during discovery.

Financial reporting and any future commercial fee logic should use agreed reconciled evidence, not agent-entered outcomes alone.

11. Data, integration, security and resilience

The platform will handle sensitive identity, financial and communication information. Trust therefore depends on explicit data purpose, source, access, change history and recovery.

Control family	Proposed approach
Identity and access	Strong authentication, least privilege and principal/role boundaries
Data authority	Named source systems, validated interfaces and immutable provenance
Sensitive-data protection	Encryption, minimisation, controlled download/export and endpoint policy
Audit	Tamper-evident history for material actions, approvals and changes
Integration safety	Schema validation, duplicate/reversal handling, retry and exception visibility
Monitoring	Availability, errors, feed failures, queue health and unusual access
Incident response	Severity, ownership, containment, communication and learning
Backup and recovery	Protected backups, recovery objectives and tested restoration
Secure change	Review, testing, controlled release, rollback and post-release monitoring

Privacy roles—controller, processor, sub-processor or other applicable role—are a discovery and contracting outcome. The technical design should follow the confirmed data-flow and responsibility map.

12. Reporting and explainable assistance

Different stakeholders need different views of the same governed truth:

- agents need today's safe actions;
- supervisors need workload, quality and exceptions;
- finance needs payment and reconciliation evidence;
- compliance needs conduct, complaints, holds and access events;
- management needs portfolio, cost, service and platform health;
- each principal needs only its own accepted portfolio results;
- TEKUN Corporation governance needs value, risk, growth and roadmap insight.

Advanced assistance should progress from descriptive reporting to diagnostic insight, then guided work and only later predictive or assisted capabilities. Any AI-supported summary, quality sampling or recommendation must remain explainable, auditable and subject to human authority.

13. Managed collection service

The technology and operating service are designed together.

Operating role	Primary responsibility	Boundary
TEKUN service owner	Principal relationship, policy, authority and outcomes	Retains governance
Collection manager	Strategy, allocation, performance and escalation	Cannot bypass independent controls
Supervisor	Queue health, coaching, daily exceptions and capacity	Acts within approved limits
Authorised representative	Verify, contact, understand, record, follow up and escalate	No money receipt or unapproved consequential decision
Complaints/hardship specialist	Protected-case assessment and coordination	Protected from target pressure where required
Finance/reconciliation	Validate payment evidence, allocation and reversals	Reconciled evidence is outcome authority
Compliance/privacy	Interpret obligations and monitor conduct/data	Independent oversight line
Platform operations	Availability, integrations, incidents and recovery	Does not redefine business policy
Product/improvement	Convert evidence into governed improvements	Roadmap jointly prioritised

Headcount, employment model, location, channels and service hours remain discovery and costing decisions.

14. Training, competency and quality

The representative lifecycle is: screen and verify → train → assess → authorise → observe and sample → coach or remediate → reassess. A material concern may suspend or revoke authorisation.

Training covers portfolio policy, identity, confidential communication, permitted contact, notices, payment routes, promises, disputes, complaints, hardship, prohibited conduct, evidence quality, privacy, security and escalation.

Quality scoring should balance outcome, accuracy, conduct, documentation and customer treatment. Recovery alone is not a complete measure of quality.

15. Service management and continuous improvement

A healthy platform detects issues, responds, recovers and learns. The operating partnership should use the same evidence discipline for software, integrations, workforce and collection processes.

The service model includes:

- availability, response and recovery objectives;
- application, integration, data-feed and queue monitoring;
- incident severity, communication and post-incident learning;
- change review, testing, release and rollback;
- backup and restoration exercises;
- operating playbooks, configuration history and data definitions;
- a visible improvement backlog jointly prioritised with TEKUN Corporation;
- feedback translated into measurable changes.

16. Why our experience is relevant

Sifututor has operated a live education service since 2018 and moved its new SIMS generation into production in May 2025. Its ecosystem coordinates multiple participant groups, operational states, financial evidence, mobile and staff channels, communications, analytics, permissions, monitoring and recovery.

That operating history demonstrates relevant patterns:

- connected identities and multi-participant workflows;
- financially sensitive records and reconciliation disciplines;
- specialised staff workspaces and governed decisions;
- multi-organisation separation;
- communications ownership and customer service operations;
- analytics, monitoring, incident response and recovery;
- controlled change with human accountability.

This is evidence of platform-operating capability, not a claim of prior debt-collection performance. Collection strategy, controls, training and proof must be designed and validated with TEKUN Corporation.

17. Business impact and measurement

The platform can influence financial contribution through a causal chain, not a guarantee.

Capability	Leading signal	Outcome signal	Possible contribution
Better portfolio data	Completeness and intake acceptance	Contactability and throughput	Faster onboarding
Guided work	Queue coverage and right-party contact	Kept promises and time to payment	More effective capacity
Payment integration	Match rate and reconciliation age	Verified collection/recovery	Clearer revenue or fee basis
Customer-treatment controls	Conduct and complaint exceptions	Service consistency	Trust and readiness
Supervisor and quality tools	Coaching closure and competency	Stable team performance	Scalable operations
Principal reporting	Timeliness and acceptance	Renewal or referral opportunity	More appointing organisations
Platform health	Availability and failed-feed rate	Fewer interrupted workflows	Revenue protection

Recovery outcomes are influenced by portfolio age, balance, product, customer circumstances, data quality, contactability, policy, legal state and economic conditions. A fair assessment uses a frozen or controlled cohort, written definitions and agreed adjustment events.

18. Balanced scorecard

“Collection rate” is not complete until the parties agree its numerator, denominator, population, period, exclusions and source.

Lens	Illustrative governed indicators
Operations	Time to first action, contact coverage, right-party contact, promises and cases per agent
Financial	Reconciled amount, collection/recovery rate, cost-to-collect and net recovery
Portfolio	Ageing, roll rate, cure rate and write-off context
Customer treatment	Complaints, resolution time, hardship outcomes, disputes and cessation
Controls	Contact, notice, identity, disclosure, payment-handling and data exceptions
Platform health	Availability, incidents, restore evidence, failed feeds and reconciliation age
Strategic growth	Active principals, onboarding time, capacity headroom and contribution

The discovery team should produce a KPI dictionary naming formula, source, owner, frequency, exclusions and misinterpretation risk.

19. Bounded pilot

The pilot should cover one principal, product or arrears cohort that is large enough to measure and bounded enough to govern.

Pilot element	Proposed rule
Baseline	Written comparable history, quality limits and known changes
Cohort	Frozen or controlled population with clear inclusions/exclusions
Authority	Approved policy, representatives, channels and escalation
Technical scope	Minimum complete lifecycle, evidence, reporting and monitoring
Evaluation	Operations, financial outcomes, customer treatment, controls and platform health
Governance	Weekly operating review and monthly decision forum
Gate	Expand, adjust, re-baseline or stop based on agreed evidence

The pilot succeeds only when performance, conduct, reconciliation and platform-health evidence are acceptable together. No result should be presented without its cohort and definition.

20. Commercial principles

Pricing cannot be responsibly set before portfolio volume, channels, service hours, staffing, integrations, risk allocation and performance definitions are known.

The recommended commercial design principles are:

- separate one-time mobilisation from recurring platform and service cost;
- connect any outcome-based element only to reconciled qualifying evidence;
- avoid incentives that reward recovery while weakening customer treatment;
- define pass-through communication or integration costs transparently;
- use service credits or remedies only against agreed measurable obligations;
- preserve export and transition support;
- review economics after a controlled pilot rather than pricing from assumptions.

No commercial archetype is selected in this proposal.

21. Milestones and roadmap

Evidence to date

Period	TEKUN Corporation track	Our platform-operating track
2014–2015	Corporate registration and stated collection call-centre establishment	—
2018–2024	Collection service continues	Live multi-stakeholder service and finance operations mature
May 2025	—	New SIMS goes live in production
2025–2026	—	Specialist staff tools, analytics, operations and monitoring deepen
2026	Public collection/recovery appointments continue	Connected operating capability continues to mature
Proposed next	Evaluate integrated platform and managed service partnership	Apply proven platform disciplines to a dedicated collection domain

Partnership horizons

Horizon	Purpose	Evidence gate
H0 — Align and baseline	Confirm authority, portfolio map, current lifecycle, sources and KPI definitions	Signed discovery outputs and decision ownership
H1 — Trusted operating foundation	Establish one bounded portfolio, identity, roles, intake, audit, queues and health	Data accepted, access tested and core journey proven
H2 — Controlled pilot	Operate authorised work with customer-treatment, payment and reporting controls	Balanced pilot evidence and reconciled outcomes
H3 — Integrated performance scale	Automate feeds, reconciliation, reporting and capacity planning	Reliable interfaces, service levels and stable definitions
H4 — Multi-principal growth	Replicate policies, segregation, onboarding and accepted reporting	New principal onboarded without uncontrolled reinvention
H5 — Governed intelligence	Add explainable assistance and evidence-led strategy	Clean history, bias/control review, human authority and measurable value

Expansion should occur only after the evidence gate for the preceding horizon is met. The roadmap shows sequence, not promised dates.

22. Long-term partnership value, assurance and transition readiness

Value deepens through four layers:

- 1. **Foundation value** — a governed platform, baseline and control model.
- 2. **Operating value** — trained teams, reliable service, integrations and evidence.
- 3. **Growth value** — faster onboarding, more principals and accepted reporting.
- 4. **Compounding value** — portfolio knowledge, trusted governance and a jointly governed roadmap.

TEKUN Corporation should retain complete export, configuration, operating records and transition support from day one. This protects institutional control while giving the operating partner a reason to remain useful through expertise and continuing improvement.

Assurance evidence

Assurance question	Evidence expected
Are only authorised people acting?	Identity, role, competency and authorisation records
Are actions permitted now?	Notice, contact, consent, hold and authority-gate evidence
Was the customer treated fairly?	Interaction history, quality sample and protected-case record
Is a collection result real?	Reconciled payment evidence and governed cohort definition
Did payment stop action correctly?	Cessation timestamp and post-stop exception report
Is each principal separated?	Access/isolation tests and principal-scoped reporting
Can an incident be understood and service recovered?	Monitoring, audit, incident, backup and restore evidence
Can TEKUN Corporation govern or transition?	Documentation, export and tested transition exercise

Transition-ready asset inventory

From mobilisation onward, the governed asset set should include usable data export; configuration and policy versions; a data dictionary; interface specifications; operating and incident runbooks; representative and competency records; open complaint, hardship, dispute and legal-hold registers; permitted interaction and reconciliation history; change and release logs; access/isolation evidence; backup and restoration proof; cessation evidence; and a tested transition plan with named owners.

23. Discovery agenda

Before an implementation or commercial commitment, the joint team should confirm:

- legal entity, portfolio and principal relationships;
- current service providers, systems, processes and pain points;
- authorisation or registration status relevant to each portfolio;
- account volumes, products, arrears, channels and historical outcomes;
- policy, notices, scripts, settlements, complaints and hardship pathways;
- customer payment route, reconciliation and fee evidence;
- data sources, roles, retention, security and integration constraints;
- workforce model, hours, languages, competency and supervision;
- baseline, KPI dictionary, pilot cohort and guardrails;
- procurement, commercial inputs, transition expectations and decision process.

These questions are not weaknesses. They are the information required to produce a responsible design and a fair business case.

24. Recommended next decision

Authorise a governed discovery and pilot co-design programme.

The joint working group should produce:

1. a current-state lifecycle and stakeholder map;
2. principal and portfolio segmentation;
3. authority, regulatory and privacy responsibility maps;
4. system, provider, data and money-flow architecture;
5. baseline, KPI and guardrail definitions;
6. a bounded pilot cohort and evidence gate;
7. solution scope, transition approach and implementation sequence;
8. commercial inputs without premature pricing.

Full implementation should be considered only after the evidence, authority, customer-treatment, technical and commercial gates are satisfied.

Evidence note

This proposal is governed by the **TEKUN Corporation Integrated Collection Growth Partnership Sourcebook v1.0**, reviewed 31 August 2026. Public factual statements remain attributed to TEKUN Corporation, TEKUN Nasional, the Consumer Credit Commission or other named primary sources in that sourcebook. Volatile regulatory information must be reverified before external circulation. Proposed capabilities describe a future design, not a current TEKUN Corporation implementation.

Selected public sources
